CHRYSALIS AWARD FOR REMODELING EXCELLENCE

2007 Best Green Remodel

This project involved an extensive renovation to the entire house, while also adding a complete second floor to the house and a new screened porch on the back. It also involved upgrading the existing HVAC system and ductwork, added insulation, replaced old windows, and brought the entire house up to EarthCraft standards. Additional measures included extensive air sealing of the building shell and sealing the basement with 10 mil. plastic. Materials were recycled, and a recycling center for all waste was established on the site. Materials gained during deconstruction such as lumber and brick were reused during the renovation, and use of engineered materials, modern framing techniques and methods of construction maximizing durability were used. This house not only produced a house exceeding EarthCraft standards, it demonstrates just how beautiful and functional a green house can be.
